Here is the discussion forum for this part of the course. Please either post your comments/observations/questions or share your creations.

Let us suggest some topics of discussion:

SUGGESTED TOPICS

- If you've read the course, then for sure you've visited this Web site webcomponents.org and browsed some Web components galleries. Did you find some super cool components? Did you try them? Please share your findings in the forum!

- Did you look at the Polymer and X-tags projects? Do you understand their philosophy? Did you try some tutorials? Did you notice that they propose a higher level approach to the creation of Web components? Do you like that or do you prefer making them using the low level techniques explained in the course?

- What Web component would you like to use and could not find out of the box?

OPTIONAL PROJECTS

- Try making your own Web component! For example: an enhanced audio player that uses Web Audio. Turn one of the examples from the course into `<audio-with-visualization>` (look at this one, for example!).

- Or a component `<gamepad-tester>` that will display the progress bars and the states of the different buttons/joysticks - reuse the example from the course! I couldn't find any Web component like this! Another challenge ;)

- Try writing a small tutorial about reusing and customizing a super cool Web component you have found!
